

# The immigration module in the 7th round of the European Social Survey and its Research possibilities

Eldad Davidov

University of Zurich and URPP “Social Networks”

Poland and its European context: Continuity and Change

March 9, 2016

# Outline

- 1) **Overview** of the new immigration module in the European Social Survey (ESS):  
Background, aims, theory, additions.
- 2) Cross-country **comparability** of the measures.
- 3) **Ongoing research**

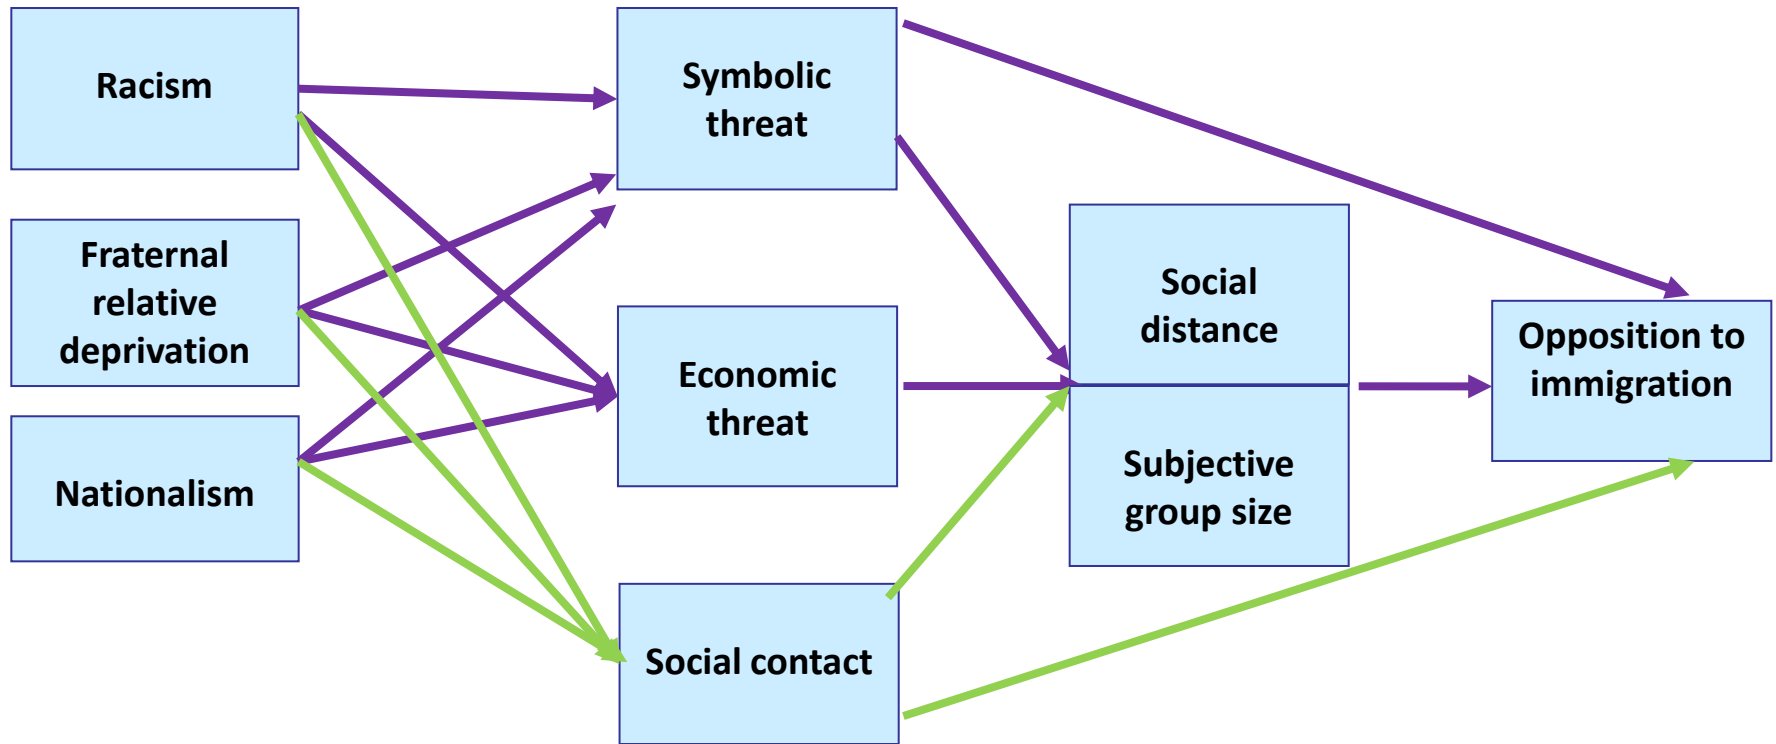

# Overview: Background

- **The team that developed the module: PI Anthony Heath, with Eldad Davidov, Robert Ford, Eva Green, Alice Ramos and Peter Schmidt**
- **Repeat** of a module fielded in the first round of the ESS in 2002/3
- **Extensively analyzed** by scholars in a wide range of disciplines
- Topic remains of **great public concern** with new debates over refugees, rules of entry, multiculturalism and integration

# The module's aims

- **Replicate** key items (especially those widely used by scholars) from Round 1 as well as those in the 'core'.
- **Improve** original measures where necessary and 'contextualize' the questions
- **Add** a few new items reflecting changes in public debate and theoretical developments

# Theoretical approach

Negative effect

Positive effect

- **Endogeneity problem:** There are other **directions of causality** possible e.g. social contacts may influence racism (see Wagner et al. and Christ et al.)
- **Socio-demographic variables** like age, gender, education, income, professional status, immigration background, religion etc. may be added on the left side of the model
- One may also consider **contextual variables, interactions etc.**

# Major additions and innovations

1. Opposition to additional groups, e.g. **Muslims, Blacks, Roma, Jews**
2. **Survey experiment:** The **experiment** will randomly assign respondents to one of **four conditions** comparing migrants with different **skill levels** (professional vs unskilled) and **origins** (European vs non-European) and ask about attitudes.
3. **Ancestry** question (to be repeated also in 2017): To understand the respondent's **origins** better
4. **Fraternal relative deprivation:** whether one believes that **one's own group** is relatively **deprived** (and not one's individual circumstances)
5. Additional items on **symbolic threat**
6. items on **frequency and quality of contact**
7. New item on **nationalism** (attachment)
8. New items on **biological and cultural racism**
9. Perceptions of **where immigrants come from** (open-ended)

# Cross-country comparability of the new measures

- Potential problems:
- Concepts in one culture may not exist or may exist in a different way in another culture.
  - *For example, when people speak about the value ‘**security**’, it is associated with personal security in Germany and with state security in Israel.*
- Even if a similar concept exists in two cultures, it may be understood differently.
  - *Translation problems may result in misinterpretation. Example: Denmark most tolerant country toward immigrants (**offense** in Danish vs. **crime** in other languages).*
  - *The term ‘**immigrant**’ was used in the ISSP also for Israel. To get a similar sense, the word ‘foreigners’ should have been used.*

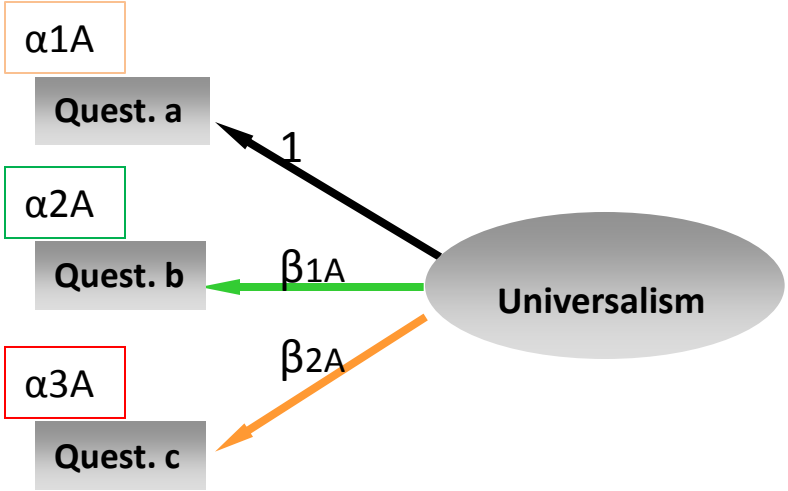

- Even if similar concepts exist in different cultures and they were correctly translated (difficult...), people may **use the response scale differently**.
  - *For example, social desirability or yes-saying tendency may be stronger in one country compared to another. In the US, it has been shown that Hispanics have a stronger tendency to agree. A similar problem in South Europe?*
  - In **Israel** one **reads** from **right to left**. In other countries from left to right. This has to be considered in the **direction** of **response categories**...

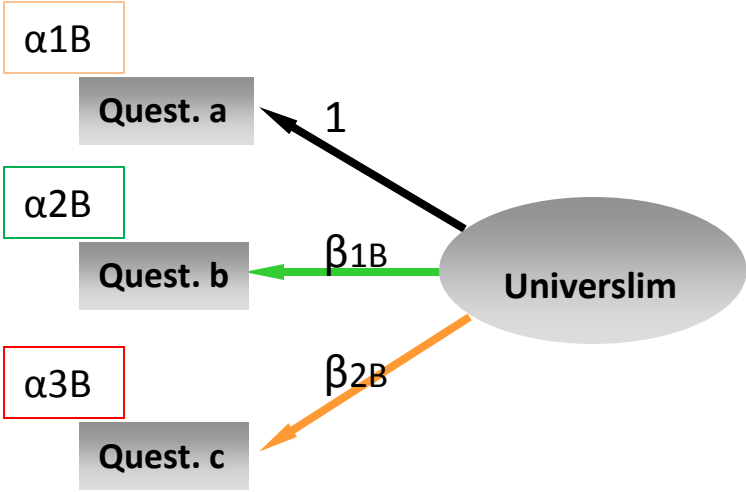

- So even if seldom done, we need to **test for comparability**
- There is a large set of statistical tools to address construct equivalence.
- We use **multi-group confirmatory factor analysis (MGCFAs)**.

# Exact measurement equivalence:

Group A (Culture, country, time point)

Group B (Culture, country, time point)

## Test for approximate (Bayesian) rather than exact measurement invariance

Comparison of exact and approximate approaches to MI  
(Muthén & Asparouhov, 2012; Van de Schoot et al., 2013; Zercher et al.2015)

**exact zero**

a very strong informative prior (like a constraint in ML)  
(with a mean and a variance of zero)

**approximate zero**

zero-mean and small-variance (.01)  
where 95% of the loading variation

# Study 1

- The comparability of attitudes toward immigration in the European Social Survey: Exact versus approximate equivalence (2015).  
Davidov, E., J. Cieciuch, P. Schmidt, B. Meuleman, R. Algesheimer, and M. Hausherr.  
*Public Opinion Quarterly* 79, 244-266.

**Latent Variable:** *Attitudes toward allowing immigrants into the country*

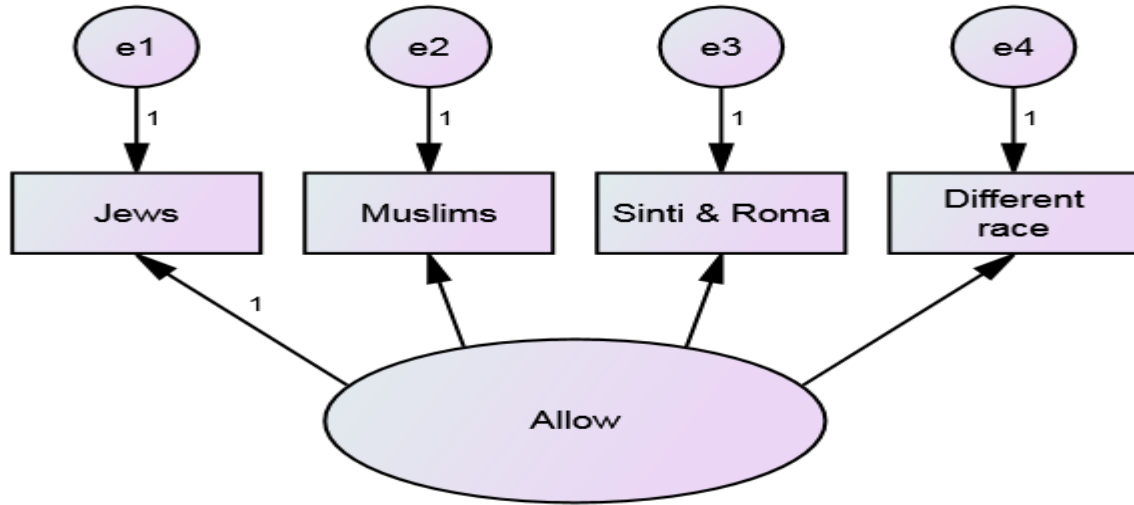

- **all countries and six rounds of the ESS of the items:**
- **Result: Approximate invariance supported in all cases – good news.**

# Study 2:

- The cross-country comparability of the immigration module in the \*new\* European Social Survey 2014-15 (in progress). Ciecuch, J., E. Davidov, P. Schmidt and R. Algesheimer.

- The measurement of **four latent variables** are tested:
- **allowing** for immigrants belonging to different ethnic groups than the majority population into the country, Muslims, Jews and Sinti & Roma;
- - **qualification** for entry;
- - two types of **threat** due to immigrants – realistic and symbolic

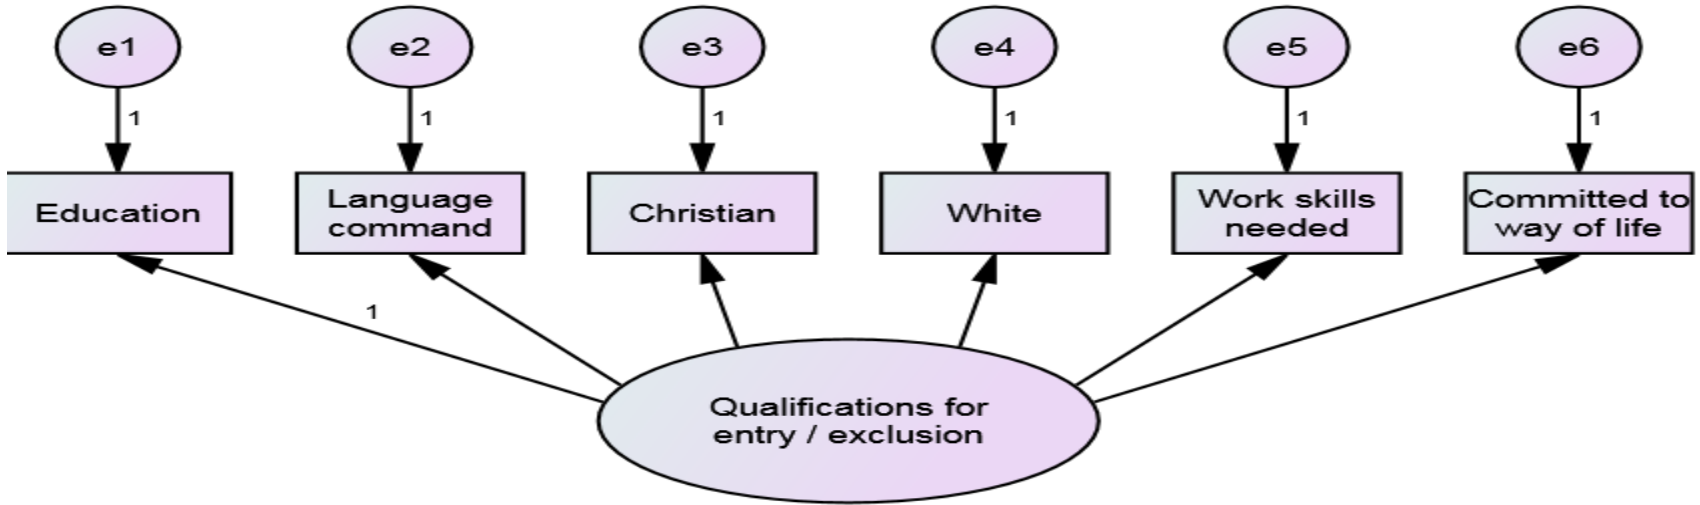

- Result:
- **Both metric and scalar invariance.**

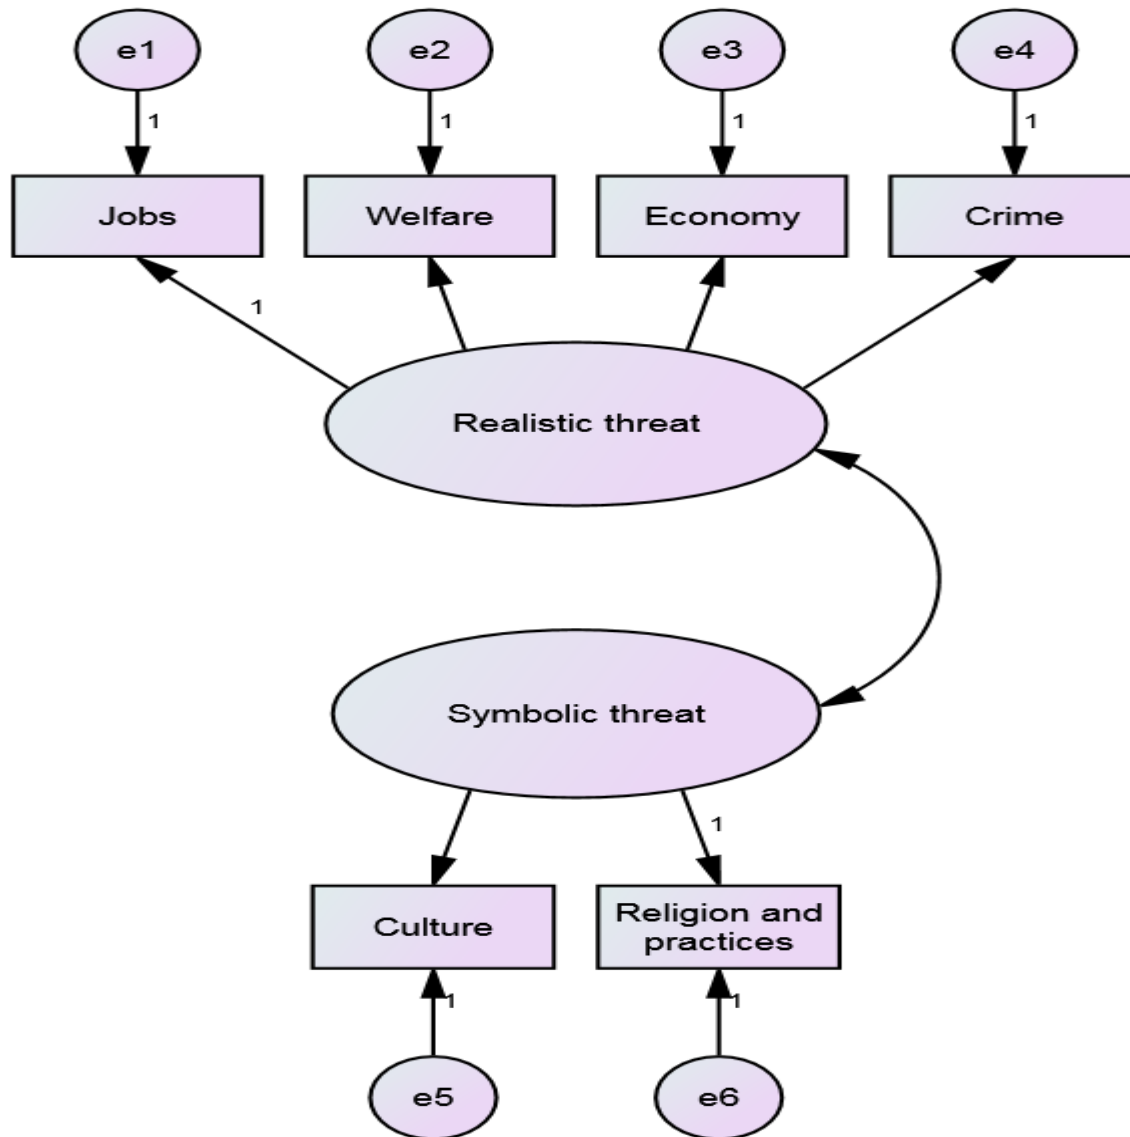

# Attitudes toward Jews, Muslims, Sinti and Roma, different race

Latent means at the scalar level of measurement invariance

- Result:
- **Metric but no scalar invariance.**
- **Approximate scalar invariance** across a subset of European countries.

- Result:
- **Metric but no scalar invariance.**
- **Approximate scalar invariance** across a subset of European countries.

# Study 3:

- Toward Understanding the Dynamic Relations between Economic Conditions and Anti-Immigrant Sentiments: a Quasi-Experiment in Times of the European Economic Crisis (R&R).  
Kuntz, A., E. Davidov and M. Semyonov

- **Research question:** Did **negative attitudes** toward immigrants tended **rise** when **economic** conditions **deteriorated** in the economic crisis of 2008?
- 14 immigration countries before (2006) and after (2010) the peak of the European economic crisis

- Main findings:
- Anti-immigrant attitudes were **more pronounced** in countries with **perceived depressed** economic conditions than in countries with **prosperous** economic conditions

# Study 4

- Nationalism and anti-immigrant sentiments:  
What is the link? Coenders, M., A. Gorodzeisky, E. Davidov, M. Semyonov and P. Schmidt. In Progress.

- **Research questions:**
- How does the relation between **nationalism** and **rejection** of immigrants **vary** across countries?
- We expect that with an **integrative** policy toward immigrants in a country and a **left wing government** this **link** would be **weaker**.
- Data: ESS Round 7, 2014.

# Study 5

- Threat and rejection: Muslim and Jewish immigrants in European societies. Coenders, M. and E. Davidov. In Progress.
- **Research question:** whether **realistic** and **symbolic** threat influence more strongly **rejection** of **Muslim** vs. **Jewish** immigrants.
- Expectations:
  - **Symbolic** threat translates to rejection significantly more strongly for **Muslim** than for Jewish immigrants
  - **Economic** threat translates to rejection in a **similar** way for Jewish and Muslim immigrants

# Study 6

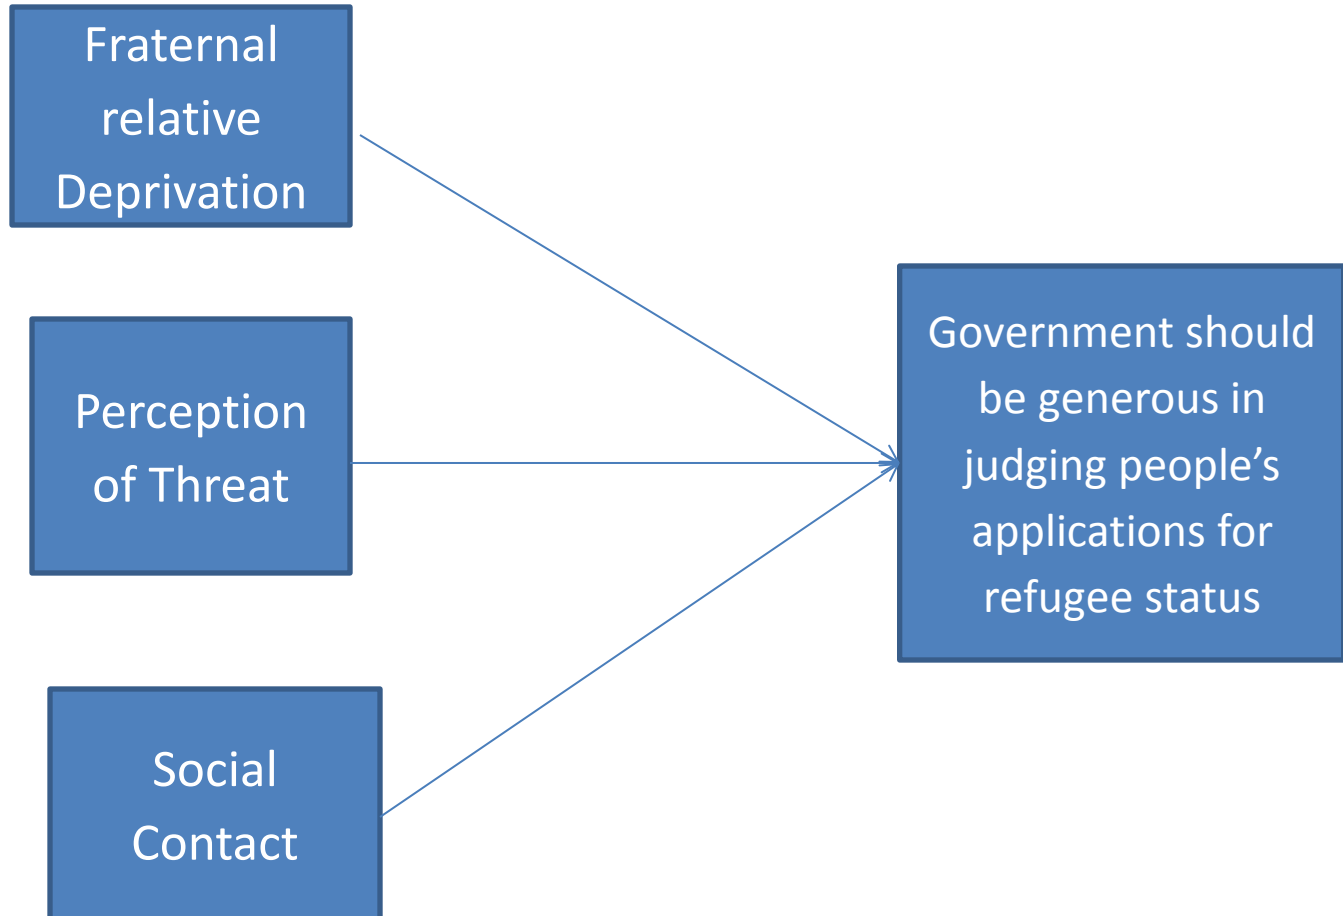

- Media use and Attitudes toward Immigration in Europe in a Cross-country Perspective.  
Masso, A., M. Coenders and E. Davidov. In Progress.

- **Research question:** Is there a positive association between **media use** and **(negative) attitudes** toward immigration in European countries?
- In addition, we expect in countries with a higher level of **media autonomy**, where **sensationalized** news is more abundant, that
  - **attitudes** toward immigrants will be more **negative**.
  - the **link** between media use and negative attitudes toward immigrants will be **stronger**.
- Data: ESS 2014.

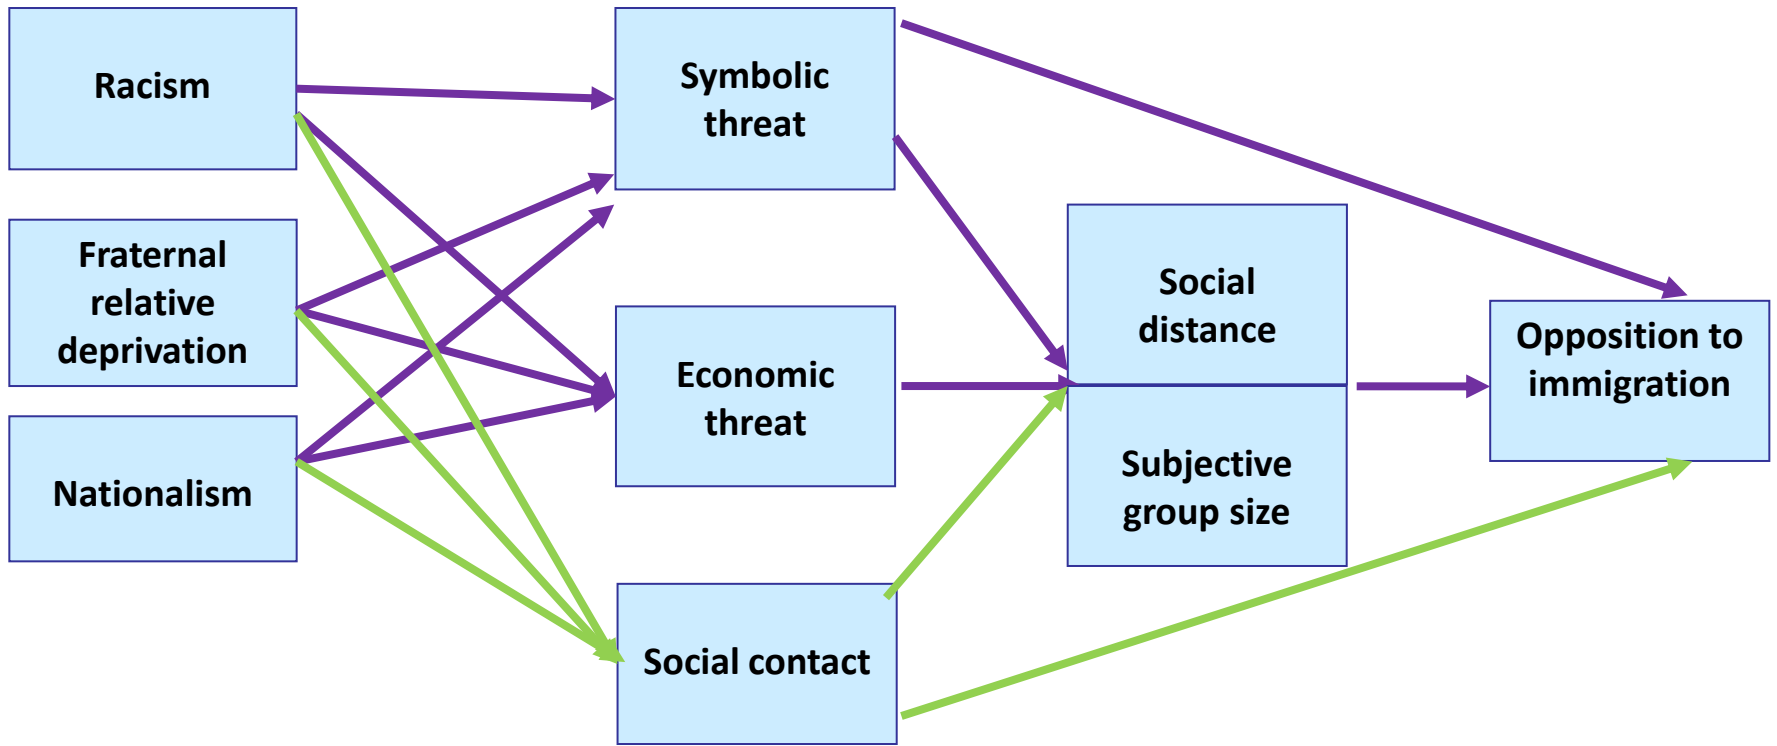

# Study 7

- Fraternal relative deprivation and rejection of refugees: A comparative analysis. Raijman, R., T. Pettigrew, P. Schmidt and E. Davidov. In Progress.

# In sum

Negative effect

Positive effect

- Thank you very much for your attention!
